

## DART Tutorial Section 1: Filtering For a One Variable System

The National Center for Atmospheric Research is sponsored by the National Science Foundation. Any opinions, findings and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation.

## Introduction

This series of tutorial presentations is designed to introduce both basic Ensemble Kalman filter theory and the Data Assimilation Research Testbed Community Facility for Ensemble Data Assimilation.

There is significant overlap with the DART_LAB tutorial that is also part of the DART subversion checkout. If you have already studied DART_LAB, feel free to skip through the redundant theory slides. However, doing the exercises in all sections of this tutorial is recommended in order to learn the best ways to use the DART system.

## Bayes' Rule

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

$A \quad:$ Prior Estimate based on all previous information, $C$.
$B \quad$ : An additional observation.
$p(A / B C) \quad:$ Posterior (updated estimate) based on $C$ and $B$.

## Bayes' Rule

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

$A \quad:$ Prior Estimate based on all previous information, $C$.
$\underline{B} \quad$ : An additional observation.
$p(A / B C) \quad:$ Posterior (updated estimate) based on $C$ and $B$.

## Bayes' Rule

$p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}$

$A \quad:$ Prior Estimate based on all previous information, $C$.
$B \quad$ : An additional observation.
$p(A / B C) \quad:$ Posterior (updated estimate) based on $C$ and $B$.

## Bayes' Rule

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

$A \quad:$ Prior Estimate based on all previous information, $C$.
$B \quad$ : An additional observation.
$p(A / B C) \quad:$ Posterior (updated estimate) based on $C$ and $B$.

## Bayes' Rule

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

$A \quad:$ Prior Estimate based on all previous information, $C$.
$B \quad:$ An additional observation.
$p(A / B C) \quad$ : Posterior (updated estimate) based on $C$ and $B$.

## Color Scheme

## Green == Prior

## Red == Observation

## Blue == Posterior

The same color scheme is used throughout ALL Tutorial materials.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

This product is closed for Gaussian distributions.

## Product of Two Gaussians

Product of d-dimensional normals with means $\mu_{1}$ and $\mu_{2}$ and covariance matrices $\Sigma_{1}$ and ${ }^{2}{ }_{2 \text { is normal. }}$.

$$
N\left(\mu_{1}, \Sigma_{1}\right) N\left(\mu_{2}, \Sigma_{2}\right)=c N(\mu, \Sigma)
$$

## Product of Two Gaussians

Product of d-dimensional normals with means $\mu_{1}$ and $\mu_{2}$ and covariance matrices $\Sigma_{1}$ and ${ }^{2}{ }_{2 \text { is normal. }}$.

$$
N\left(\mu_{1}, \Sigma_{1}\right) N\left(\mu_{2}, \Sigma_{2}\right)=c N(\mu, \Sigma)
$$

Covariance:

$$
\Sigma=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}
$$

Mean:

$$
\mu=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}\left(\sum_{1}^{-1} \mu_{1}+\sum_{2}^{-1} \mu_{2}\right)
$$

## Product of Two Gaussians

Product of d-dimensional normals with means $\mu_{1}$ and $\mu_{2}$ and covariance matrices $\Sigma_{1}$ and ${ }^{2}{ }_{2 \text { is normal. }}$.

$$
N\left(\mu_{1}, \Sigma_{1}\right) N\left(\mu_{2}, \Sigma_{2}\right)=c N(\mu, \Sigma)
$$

Covariance: $\quad \Sigma=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}$
Mean:

$$
\mu=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}\left(\sum_{1}^{-1} \mu_{1}+\sum_{2}^{-1} \mu_{2}\right)
$$

Weight: $\quad c=\frac{1}{(2 \Pi)^{d / 2}\left|\Sigma_{1}+\Sigma_{2}\right|^{1 / 2}} \exp \left\{-\frac{1}{2}\left[\left(\mu_{2}-\mu_{1}\right)^{T}\left(\Sigma_{1}+\Sigma_{2}\right)^{-1}\left(\mu_{2}-\mu_{1}\right)\right]\right\}$
We'll ignore the weight unless noted since we immediately normalize products to be PDFs.

## Product of Two Gaussians

Product of d-dimensional normals with means $\mu_{1}$ and $\mu_{2}$ and covariance matrices $\Sigma_{1}$ and ${ }^{2}{ }_{2 \text { is normal. }}$.

$$
N\left(\mu_{1}, \Sigma_{1}\right) N\left(\mu_{2}, \Sigma_{2}\right)=c N(\mu, \Sigma)
$$

Covariance: $\quad \Sigma=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}$
Mean:

$$
\mu=\left(\sum_{1}^{-1}+\sum_{2}^{-1}\right)^{-1}\left(\sum_{1}^{-1} \mu_{1}+\sum_{2}^{-1} \mu_{2}\right)
$$

Weight: $\quad c=\frac{1}{(2 \Pi)^{d / 2}\left|\Sigma_{1}+\Sigma_{2}\right|^{1 / 2}} \exp \left\{-\frac{1}{2}\left[\left(\mu_{2}-\mu_{1}\right)^{T}\left(\Sigma_{1}+\Sigma_{2}\right)^{-1}\left(\mu_{2}-\mu_{1}\right)\right]\right\}$
Easy to derive for 1-D Gaussians; just do products of exponentials.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

This product is closed for Gaussian distributions.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

This product is closed for Gaussian distributions.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

This product is closed for Gaussian distributions.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

Ensemble filters: Prior is available as finite sample.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

How can we take product of sample with continuous likelihood?

Fit a continuous (Gaussian for now) distribution to sample.

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

Observation likelihood usually continuous (nearly always Gaussian).

## Product of Two Gaussians

$$
p(A \mid B C)=\frac{p(B \mid A C) p(A \mid C)}{p(B \mid C)}=\frac{p(B \mid A C) p(A \mid C)}{\int p(B \mid x) p(x \mid C) d x}
$$

Product of prior Gaussian fit and Obs. likelihood is Gaussian.

## Sampling Posterior PDF

There are many ways to do this.

Exact properties of different methods may be unclear.
Trial and error still best way to see how they perform. Will interact with properties of prediction models, etc.

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

Compute posterior PDF (same as previous algorithms).

## Sampling Posterior PDF

## Ensemble Adjustment (Kalman) Filter

Use deterministic algorithm to 'adjust' ensemble.

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

Use deterministic algorithm to 'adjust' ensemble.

1. 'Shift' ensemble to have exact mean of posterior.

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

Use deterministic algorithm to 'adjust' ensemble.

1. 'Shift' ensemble to have exact mean of posterior.
2. Use linear contraction to have exact variance of posterior.

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

Bimodality maintained, but not appropriately positioned or weighted. No problem with random outliers.

## Sampling Posterior PDF

Ensemble Adjustment (Kalman) Filter

There are a variety of other ways to deterministically adjust ensemble. Class of algorithms sometimes called deterministic square root filters.

## $1^{\text {st }}$ look at DART Diagnostics

```
cd models/lorenz_63/work in your DART sandbox.
./workshop_setup.sh Does stuff you'll learn to do later.
matlab -nodesktop
```

Output from a DART assimilation in 3-variable model.
20 member ensemble.
Observations of each variable once every '6 hours'; error variance 8.
Observation ONLY impacts its own state variable.
For assimilation, looks like 3 independent single variable problems.
Model advance between assimilations isn't independent.

Initial ensemble members are random selection from long model run. Initial error should be an upper bound (random guess).

## $1^{\text {st }}$ look at DART Diagnostics

Try the following Matlab commands. Each will ask you to:
Input name of ensemble trajectory file:
<cr> for preassim.nc
Just select the default file by hitting carriage return for all Matlab exercises for now.
plot_total_err
time series of distance between prior ensemble mean and truth in blue; spread, average prior distance between ensemble members and mean, in red. (Record total values of total error and spread for later.)
plot_ens_mean_time_series
time series of truth in blue; ensemble mean prior in red. Figure 1 is separate panel for each state variable. Figure 2 is three-dimensional plot.
plot_ens_time_series
also includes prior ensemble members in green for Figure 1.

## Simple Example: Lorenz 63 3-variable chaotic model

Observation in red.

Prior ensemble in green.

Observing all three state variables.

Obs. Error variance $=4.0$.

Four 20-member ensembles.

## Simple Example: Lorenz 63 3-variable chaotic model

## Observation in red.

Prior ensemble in green.
$20-20$

## Simple Example: Lorenz 63 3-variable chaotic model

## Observation in red.

Prior ensemble in green.
$20-20$

## Simple Example: Lorenz 63 3-variable chaotic model

## Simple Example: Lorenz 63 3-variable chaotic model

## Observation in red.

Prior ensemble in green.

Ensemble is passing through an unpredictable region.

## Simple Example: Lorenz 63 3-variable chaotic model

## Observation in red.

## Prior ensemble in green.

Part of the ensemble heads for one lobe, the rest for the other..

## Simple Example: Lorenz 63 3 -variable model

## Using DART Diagnostics

Using DART diagnostics from the simple Lorenz 63 assimilation:

Can you see evidence of enhanced uncertainty?

Where does this occur?

Does the ensemble appear to be consistent with the truth?
(Is the truth normally inside the ensemble range?)
